Hawk/Dove Monitor

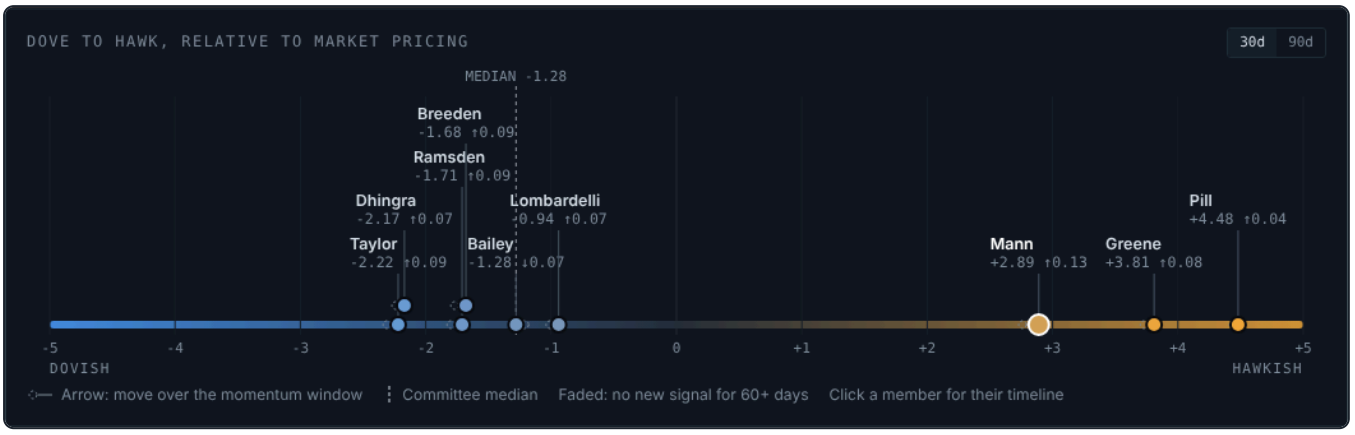

A live read of where each policymaker at the Bank of England and the Bank of Japan stands on interest rates, built from what they say and how they vote. This guide explains what the dashboard shows, how each number is made, and where to be careful with it.

Dashboard: claude.ai/artifact/RySoJqZaBNKLy9wMRD31RT Data as of 20 Oct 2026 Owner: Ollie

The idea in one minute

Every voting member of the **BoE Monetary Policy Committee** (9 members) and the **BoJ Policy Board** (9 members) gets a **stance** on a scale from **-5 (dovish)** to **+5 (hawkish)**. Hawkish means wanting tighter policy than markets currently expect; dovish means wanting looser policy than markets expect.

The stance is a weighted average of everything the member has said and every vote they have cast over roughly the last ten months. Votes count most, dissents most of all. Older material fades out gradually, so the stance moves as members speak and vote, and every point on the dashboard links back to the exact quote or vote behind it.

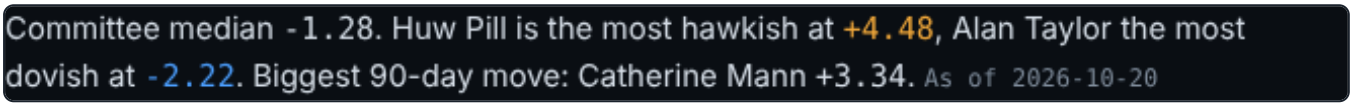

The main view for the BoE: each member placed by stance, the committee median as a dashed line, and an arrow for recent movement.

Reading the dashboard

1. Header and summary line

Switch between the two banks with the **BoE** and **BoJ** tabs. The sentence under the title gives the committee median, the most hawkish and most dovish members, and the biggest move over 90 days, with the date the data runs to.

2. The dove to hawk axis

- **Position** is the member's current stance. Colour runs from blue (dovish) through grey to amber (hawkish).
- **Dashed line**: the committee median, a quick read on where the centre of the committee sits.

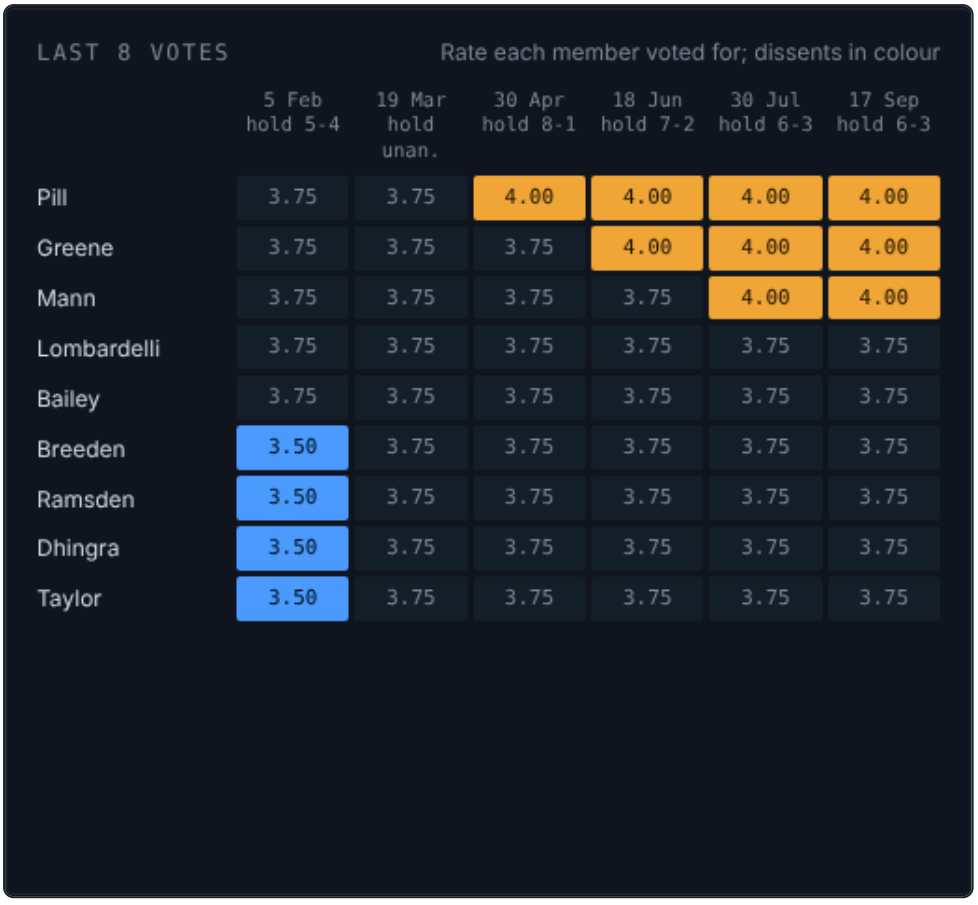

- **Arrow**: how far the member has moved over the momentum window, from a hollow ring (where they were) to the dot (where they are). Switch between **30d** and **90d** at the top right. The figure after the stance (for example `↑0.13`) is the same move as a number.
- **Faded**: no new signal from that member for more than 60 days. **Held since**: nothing in the last ten months, so the stance is frozen at its last value.
- Members with almost identical stances are stacked so every dot stays visible. **Click any name or dot** to open that member's timeline.

3. Last 8 votes

The policy rate each member voted for at each recent meeting. Grey cells voted with the majority. **Amber** cells dissented for tighter policy; **blue** cells dissented for looser policy. A blank cell means the person was not yet on the committee or was absent.

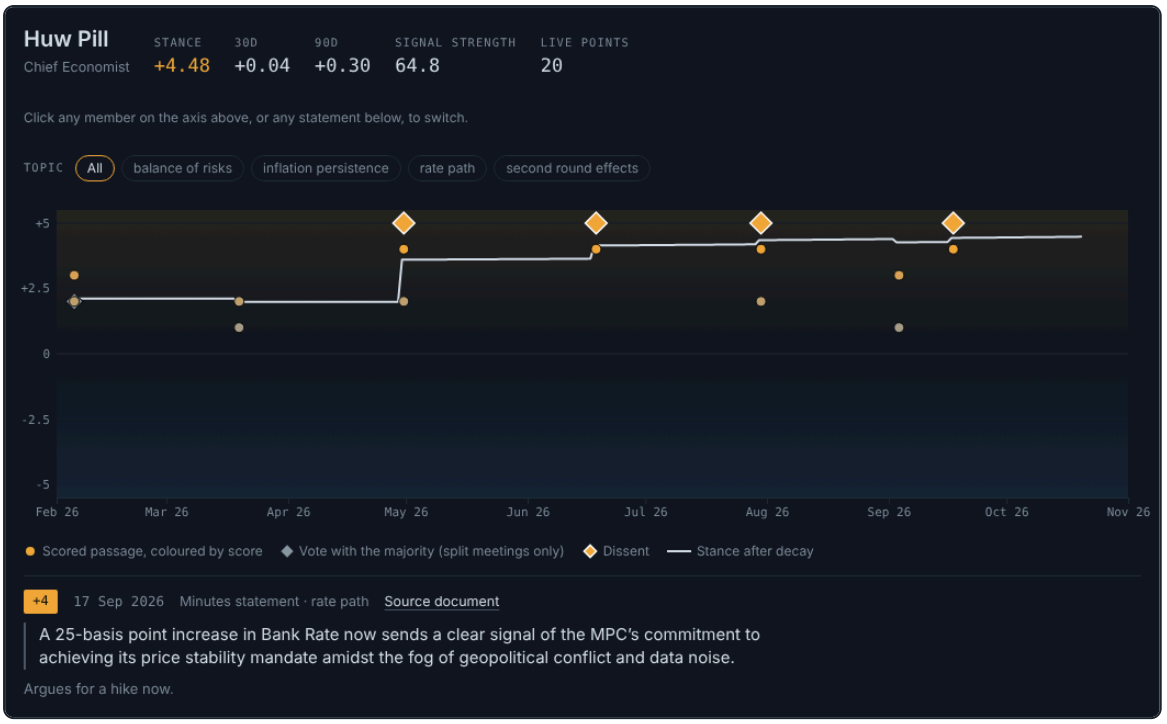

4. Newest scored statements

The latest passages to be scored, newest first, each with its score, speaker, date and source type. Click one to jump to it in that member's timeline.

BoE votes in 2026: four doves dissented for a cut in February; Pill, Greene and Mann have dissented for a hike since April.

5. A member's timeline

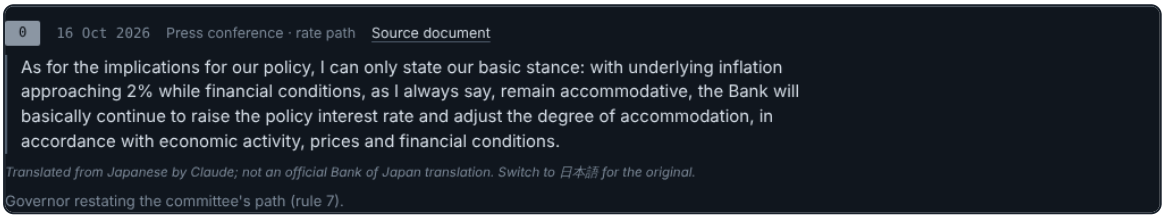

Huw Pill: the white line is his stance over time; dots are scored passages; amber diamonds are his dissents for a hike. The panel at the bottom shows the selected passage.

- **White line**: the member's stance on each day, after decay. It steps when a new statement or vote arrives.
- **Dots**: individual scored passages, placed at their score (not their stance) and coloured the same way. Hover for a preview; click to show the full quote, the date, the source type, a link to the original document, the score and a one-line reason.
- **Diamonds**: votes. Outlined diamonds are dissents. Grey diamonds are votes with the majority, which are only recorded at split meetings.
- **Topic chips** fade every passage that does not touch the chosen topic (energy, wages, neutral rate, and so on), so you can see a member's view on one theme.
- The figures at the top: **stance**, **30d** and **90d** movement, **signal strength** (how much live weight sits behind the stance: higher means better supported) and **live points** (how many statements and votes still count).

6. Bank of Japan specifics

BoJ speeches are published in English. The **press conferences are published only in Japanese**, so they are scored from the Japanese text. The **English / 日本語** switch on the BoJ tab shows an English translation by default (labelled as Claude's translation, not the Bank's) or the original Japanese. The BoJ names only dissenters in its decisions; everyone else voted with the majority.

A Governor Ueda press conference passage shown in translation. Restating the committee's agreed path scores 0 for the Governor.

How a stance is made

1. COLLECT
Official sources only: BoE speeches and MPC minutes; BoJ speeches, policy statements and press conferences.

2. SCORE
Each document is split into short passages about policy, and each passage is scored against a written rubric.

3. WEIGHT AND DECAY
Each score is weighted by its source and by age, then averaged per member.

4. PUBLISH
Stances, timelines and votes are pushed to the dashboard, and every score is kept for audit.

The scale

Whole numbers only, always judged **relative to what markets are pricing**, so the same words can score differently at different times. The extremes are reserved for votes and explicit calls for an immediate move.

SCORE	MEANING	EXAMPLE
+5	Votes against the majority for a hike, or explicitly calls for an immediate larger hike	Pill, Greene, Mann voting for 4% against a 6-3 hold (Sep 2026)
+4	Argues for tightening now or very soon	Masu: "desirable to raise the policy rate at the earliest stage possible"
+3	Further tightening likely needed, or sooner than markets expect	Greene: waiting for evidence "would leave policy behind the curve"
+2	Clear hawkish tilt; conditional case for tightening	Breeden: if risks crystallise, "increasingly appropriate for Bank Rate to respond"
+1	Leans hawkish: readiness to act	Bailey: "ready to adjust course as needed"
0	Balanced, data-dependent, or the Governor restating the agreed path	Ueda: the Bank "will continue to raise the policy interest rate"
-1	Leans dovish: caveats and balancing language	Taylor: an extended hold is "appropriately measured"
-2	Clear dovish tilt: prefers waiting, growth concerns	Dhingra: "value in waiting for a clearer read"
-3	Policy is tight enough, or easing sooner than markets expect	Breeden: policy should be eased "faster than implied by the current market path"
-4	Argues against the next expected move, or for easing soon	Ramsden: would have voted for a cut but for the conflict
-5	Votes against a hike or for a cut against the majority	Asada and Sato voting against the BoJ hike to 1.25% (Sep 2026)

Weights

SOURCE	WEIGHT
Dissenting vote	18
Vote with the majority (split meetings only)	12
Speech, press conference, testimony, written statement in the BoE minutes	6
Comment, interview, podcast	5

A speech carries its weight once in total, shared between its passages, so a long speech does not count more than a short one. Each score is also weighted by the scorer's confidence.

Decay

Each point counts in full on the day it happens and fades in a straight line to zero over **304 days (ten months)**. A speech from five months ago counts about half as much as one today.

If everything a member has said has expired, the stance is **held** at its last value rather than dropping to zero.

How votes are scored

By rule, not by judgement: a dissent for a hike is +5, for a cut or against a hike -5, for a larger or smaller move than the majority ±3. At split meetings, members in the majority get ±2 on the side opposite the dissenters. At unanimous meetings nothing is recorded.

> **Votes dominate.** For most members, votes carry 80 to 90% of the live weight. Example: Takata (+3.55) and Tamura (+1.33) at the BoJ say similar things, and Tamura's words actually score slightly more hawkish. The gap comes from votes: Takata dissented for a hike in January, March, April and July 2026; Tamura dissented only in April and otherwise voted with the majority.

Where to be careful

This is a **prototype**. It is useful for seeing who leans which way and how that is changing, but read the numbers with these points in mind.

- **The scoring rubric is still being calibrated.** In a blind test against Ollie's own labels, the current rules (v1) scored 77% of statements within one point; the target is 85%. A revised version (v2) is in use and is waiting for its own blind test.
- **No market baseline before 16 October 2026.** The scale is meant to be relative to market pricing, but historical market data has not been loaded yet, so earlier statements were scored against the policy rate and the last decision instead.
- **The majority-vote rule is under review.** Members who vote with a holding majority while others dissent for a hike get -2 at weight 12. This pulls some members dovish even when their speeches are hawkish (Masu and Tamura at the BoJ, Lombardelli at the BoE). Treat the middle of each committee with more caution than the ends.
- **Coverage starts in 2026.** Two years of history will be added. BoJ speeches published only in Japanese are not yet included.
- **BoJ translations are Claude's,** not official Bank of Japan translations. Scores are based on the Japanese original.
- **Small differences are noise.** A gap of a few tenths between two members means little; a gap of two points or more is a real difference in what they have said and how they have voted.
- **Updates are manual for now.** An automatic update every two hours on weekdays is the next step. Until then, check the "as of" date in the summary line.

Glossary

Hawkish / dovish	Wanting tighter / looser policy than markets currently expect.
Stance	The member's weighted, decayed average score, from -5 to +5.
Momentum (30d, 90d)	Change in stance over the last 30 or 90 days. Positive is a move toward hawkish.
Signal strength	Total live weight behind a stance. Higher means it rests on more, and more recent, evidence.
Live points	Statements and votes still within the ten-month window.
Split meeting	A policy meeting where at least one member dissented.
Institutional	A Governor or deputy speaking for the committee rather than for themselves; the restated path scores 0.
OIS baseline	Market pricing of future policy rates from overnight index swaps, the reference point for hawkish and dovish.
Neutral rate	The rate that neither stimulates nor restrains the economy. "Move toward neutral" means hikes at the BoJ (below neutral) and cuts at the BoE (above neutral).

Questions and feedback

Ask Ollie. If a score looks wrong, click the dot to see the quote and the reason behind it, then send the member, the date and what you would have scored it. Disagreements like these are exactly what improves the rubric.
